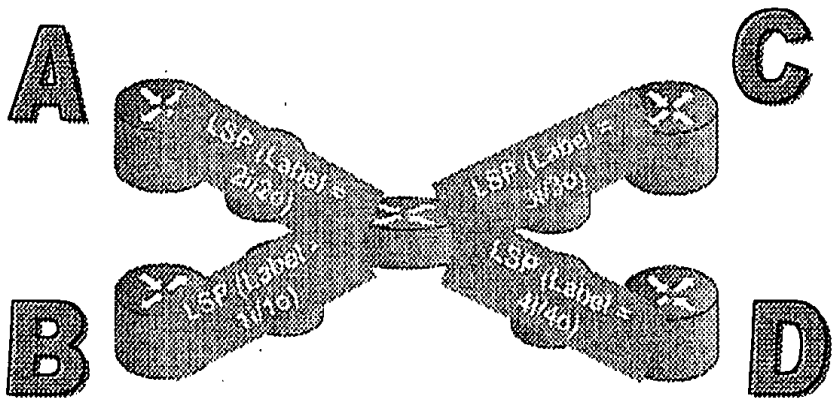
Figure 4



- Use the label assigned to an MPLS LSP as a vector quantity
- Use a stack of such labels to form a vector describing path across a network
- For paths across the illustrated network, the following label stacks would be used:
  - A to D → 2i<>2o/4i
  - B to C → 1i<>1o/3i
  - B to D → 1i<>1o/4i
- Per-LSP bandwidth monitoring permits accurate edge allocation of traffic to each path vector
